

2gather — Project Results

Course: Advanced Software Technology · **Coach:** Dániel Leskó **Project:** Collaboration in Local Communities **Team:** Sándor Baranyi (CT9XFJ), Babayev Ilkin (B96B92), Máté Kovács (U5BKY4), Adorján Nagy-Mohos (D5VD5E), Mátyás Székely (AMRIGW) **Budapest, 2026**

2gather is a bilingual (HU/EN) neighbour-help platform. Every member is both a **Seeker** (post a task) and a **Helper** (accept one). Discover people nearby, agree the terms in chat, complete the task, and build a public reputation — turning a neighbourhood into a self-sustaining micro-cooperation community.

1. Marketing material for end users

Deliverable: short feature presentation/flier + a ≤ 2 -minute product video. **Video:** <link to the ≤ 2 -minute demo video — fill in before submission> **Flier / slide deck:** <link or docs/results/2gather-flier.pdf — fill in before submission>

Why you need 2gather (end-user pitch)

You need a shelf mounted, a sofa moved, an hour of maths tutoring — and you don't have anyone nearby to ask. 2gather connects you with real people in your own area who can help, today.

Feature	What it gives you
Post a task in seconds	Title, description, category, location, and whether it's paid, barter, or voluntary — visible to helpers right away.
Find help nearby	Browse the Helper Feed and filter by category, distance, and compensation. Location-aware so results are genuinely local.
Skill matching	Helpers see the tasks that match their listed skills first.
Chat before you commit	One-on-one in-app chat opens as soon as interest is expressed — agree details safely before meeting.
Reputation you can trust	Every completed task ends with a star rating + written review. Profiles show average rating, completed-task count, and recent reviews.
Earn points for helping	Helpers automatically earn platform points on every completed task.
Your language	Full Hungarian and English UI.

2. Link to the testable product + how to try it

- **Live app:** <production URL — fill in / confirm before submission (brand domain: 2gather.hu)>

- **Admin KPI dashboard:** `<live URL>/admin` (admin role required — read-only metrics)

How to try it

1. Open the live app and click **Register** (email + password, or social login).
2. Accept the **Terms & Conditions** (mandatory one-time gate).
3. Complete your **profile**: name, bio, skills, workplace, position, location, photo.
4. On the **Seeker Feed**, click **Post a task** — fill in title, description, category, location, and compensation type.
5. Switch to the **Helper Feed**, use the filters (category / distance / compensation) to find a task, and **express interest / accept**.
6. A **chat** opens between seeker and helper — coordinate the details there.
7. Move the task through **Open** → **In Progress** → **Completed**; both parties confirm.
8. Leave a **rating + review**. Watch the **reputation** update on the profile.

Run it locally (reviewers)

```
# Full stack: backend + frontend + Postgres + Cosmos emulator
docker compose up
```

See the repository [README.md](#) for prerequisites and IDE-based workflows.

3. Development-progress links (VCS · CI · bug tracker · agile)

Resource	Link
Version control (GitHub)	https://github.com/kovacsmate3/collaboration-in-local-communities
CI/CD (GitHub Actions)	<code>.github/workflows/</code> — backend CI, frontend CI, E2E, Qodana code quality, and CD pipelines (GHCR image build → Azure Container Apps backend + Vercel frontend)
Bug tracker (GitHub Issues)	https://github.com/kovacsmate3/collaboration-in-local-communities/issues
Agile board (GitHub Projects)	Issues organised into Epics (milestones: Sprint 0–4) and a Kanban board
Code quality	Qodana (PR mode) + Codecov coverage integration

Process at a glance: 1 setup sprint + 3 two-week development sprints + 1 polish/demo sprint (20 Apr – 13 Jun 2026). Every task tracked as an issue under a sprint milestone; PR-based workflow with required CI checks, StyleCop/ESLint gates, and a Sprint-1 retrospective (Assignment 4) feeding process improvements.

4. Documentation

4.1 User stories — implemented vs. not implemented (vs. planned MVP scope)

The MVP scope (Assignment 2) selected **10 user stories** (9 Must-Have + 1 Should-Have) across **7 modules**, plus 3 implicitly-covered stories, 3 deferred (Could-Have), and 2 excluded (Won't-Have).

MVP stories — built

ID	User story	MoSCoW	Status	Evidence (issues)
US-01	Find / post help (Seeker Feed, post a task)	Must	✓ Implemented	#30, #37, #38, #236, #239
US-04	Search & filter by predefined categories	Must	✓ Implemented	#13, #33, #41, #111
US-09	See tasks matching my skills	Must	✓ Implemented	#19, #32, #35
US-11	Build reputation via completed tasks & feedback	Must	✓ Implemented	#51, #52, #62, #63
US-12	Know if help is paid / point-based / voluntary	Must	✓ Implemented	#38, #41
US-14	See ratings & written reviews	Must	✓ Implemented	#51, #59, #62, #115
US-15	Chat securely before meeting	Must	✓ Implemented	#46–#50, #56–#58, #117
US-16	Read a short helper description	Must	✓ Implemented	#17, #24, #112
US-02	Location-based proximity discovery	Should	✓ Implemented	#12, #34, #39, #42
US-10	Earn points/benefits for helping	Must	⚠ Partial	earning + ledger entity done (#54, reward service); balance/history endpoint (#53), points page (#64), and reward algorithm (#237) still open

Supporting modules delivered (platform prerequisites, not standalone stories): Registration & Onboarding, Login/Logout/Session, T&C gate, editable Profile + privacy toggle, Job/Task lifecycle management, bilingual HU/EN, and the Admin KPI dashboard. Issues: #14–#27, #36, #54, #55, #60, #61, #72, #73, #114, #116, #120, #132, #138.

Implicitly covered (no separate implementation required — served by Must-Haves)

ID	Use case	Covered by
US-06	Newcomer discovery	Seeker/Helper Feeds (US-01, US-09)
US-07	Furniture moving without social debt	Task posting + "Moving" category + compensation label (US-01, US-04, US-12)
US-08	Tutoring requests	"Tutoring" category in the posting flow (US-04)

Deferred — Could-Have (intentionally out of MVP, planned post-launch)

ID	Feature	Fallback shipped in MVP
US-03	Typo-tolerant / fuzzy search	Category browsing + filters
US-17	Smart digital agreements	Chat + task description + compensation label

ID	Feature	Fallback shipped in MVP
US-18	Advanced granular privacy controls	Basic public/private field toggle shipped (#114)

Excluded — Won't-Have (infrastructure prerequisites beyond project scope)

ID	Feature	Why excluded / mitigation
US-05	AI intelligent matching	Needs trained ML model on real transaction data; manual search + skill-tag surfacing covers ~80% of value
US-13	Government ID verification	Needs third-party identity provider + legal compliance; trust addressed via profile photos, reviews (US-14), chat (US-15)

MVP realization ratio

10 / 10 MVP stories addressed; 9 fully implemented, 1 (US-10) partially (points are earned and ledgered, but the user-facing balance/history view and the configurable reward algorithm are still open). All 7 planned modules are usable end-to-end: a user can register, post or find a task, chat, complete it, and leave a review.

Action before submission: decide whether to (a) finish US-10's points page (#53/#64/#237) to reach a clean 10/10, or (b) submit as-is and report US-10 as "earning implemented, viewing/redeeming deferred." Either is defensible; (a) maximises the MVP Realization Ratio rubric score.

4.2 User statistics & KPI calculation vs. original target

Chosen KPI — Activity KPI (Assignment 2). It combines task throughput, engagement, and quality into one number, averaged per community:

$$\text{Activity KPI} = ((\text{Tasks} / \text{All Users}) \times \text{Active Users} \times \text{Completion Rate}) / \text{Number of Communities}$$

- **All Users** — registered accounts not labelled abandoned (abandoned after 3 months inactivity)
- **Active Users** — unique users with a task interaction (post/accept/complete/review) in the rolling window
- **Completion Rate** — tasks confirmed by both parties ÷ total posted (excludes tasks < 48 h old)
- **Communities** — locations with ≥ 30 registered users

Original target (Assignment 2):

Metric	Week 1–2	Week 3–4	Month 2	Month 3 (project-end target)	Month 6 (post-launch)
Registered users	30	60	120	200	680
Active users	20	35	65	90	265
Tasks posted	10	25	45	70	215
Completion rate	1.00	0.85	0.80	0.75	0.70
Communities	1	1	1	1	2
Activity KPI	6.67	12.40	19.50	23.63	29.33

Primary project commitment: Activity KPI ≥ 23.63 by end of Month 3 (one established BME/ELTE community).

Actual measured results (read live from the Admin KPI dashboard at `/admin` ; the endpoint reports `RegisteredUsers` , `ActiveUsers7d` , `TasksPosted7d` , `CompletedTasks7d` , `CompletionRate7d`):

Metric	Target (Month 3)	Actual (measured <date>)
Registered users	200	<fill>
Active users (7-day)	90	<fill>
Tasks posted (7-day)	70	<fill>
Completion rate	0.75	<fill>
Communities	1	<fill>
Activity KPI	23.63	<compute with formula above>

KPI realization ratio = Actual Activity KPI $\div$ 23.63 = <fill>.

Note on measurement honesty: these actuals must be pulled from the running platform's database via the admin dashboard at submission time — they are not estimated here. The soft-launch (target: 30+ accounts, 2 weeks before deadline) is the data source. If the live numbers are below target because the launch window was short, report the real figure and contextualise it against the Week 1–2 / Week 3–4 milestones (6.67 / 12.40), which match a fresh launch more realistically than the Month-3 figure.

Appendix — outstanding work at time of writing

Snapshot of open issues (verified against the codebase, 2026-06-10):

Issue	Area	Bearing on Results submission
#70 / #71 / #69 / #246	Production deploy, soft launch, Key Vault secrets, Data-Protection keys	Gates deliverable #2 (the live product link). CD pipelines exist; confirm prod is actually live + soft-launch accounts created.
#53 / #64 / #237	Points balance/ledger endpoint, points page, reward algorithm	US-10 partial — affects MVP Realization Ratio.
#67	Security audit (OWASP Top 10)	In progress; close before launch.
#44 / #45 / #77	E2E post-task test, demo seed data, full E2E run	#45 demo seed missing (helps the demo); #44 post-task E2E missing.
#74 / #75 / #76 / #184 / #244	Empty/error states, UX polish + mobile QA, performance, FE quality, typography	Sprint-4 polish; improves demo/marketing quality.
#78	Demo preparation (slides, script, backup video)	Produces deliverable #1 (marketing material + video).
